UIPATH AUTOMATION PLAYBOOK

Automating Business Processes with WeCPQ & WeSAP

Purchase-to-Pay and Order-to-Cash — from as-is manual process to a to-be automated one.

WeCPQ · CPQ / quoting

WeSAP · SAP-style ERP

UiPath · automation layer

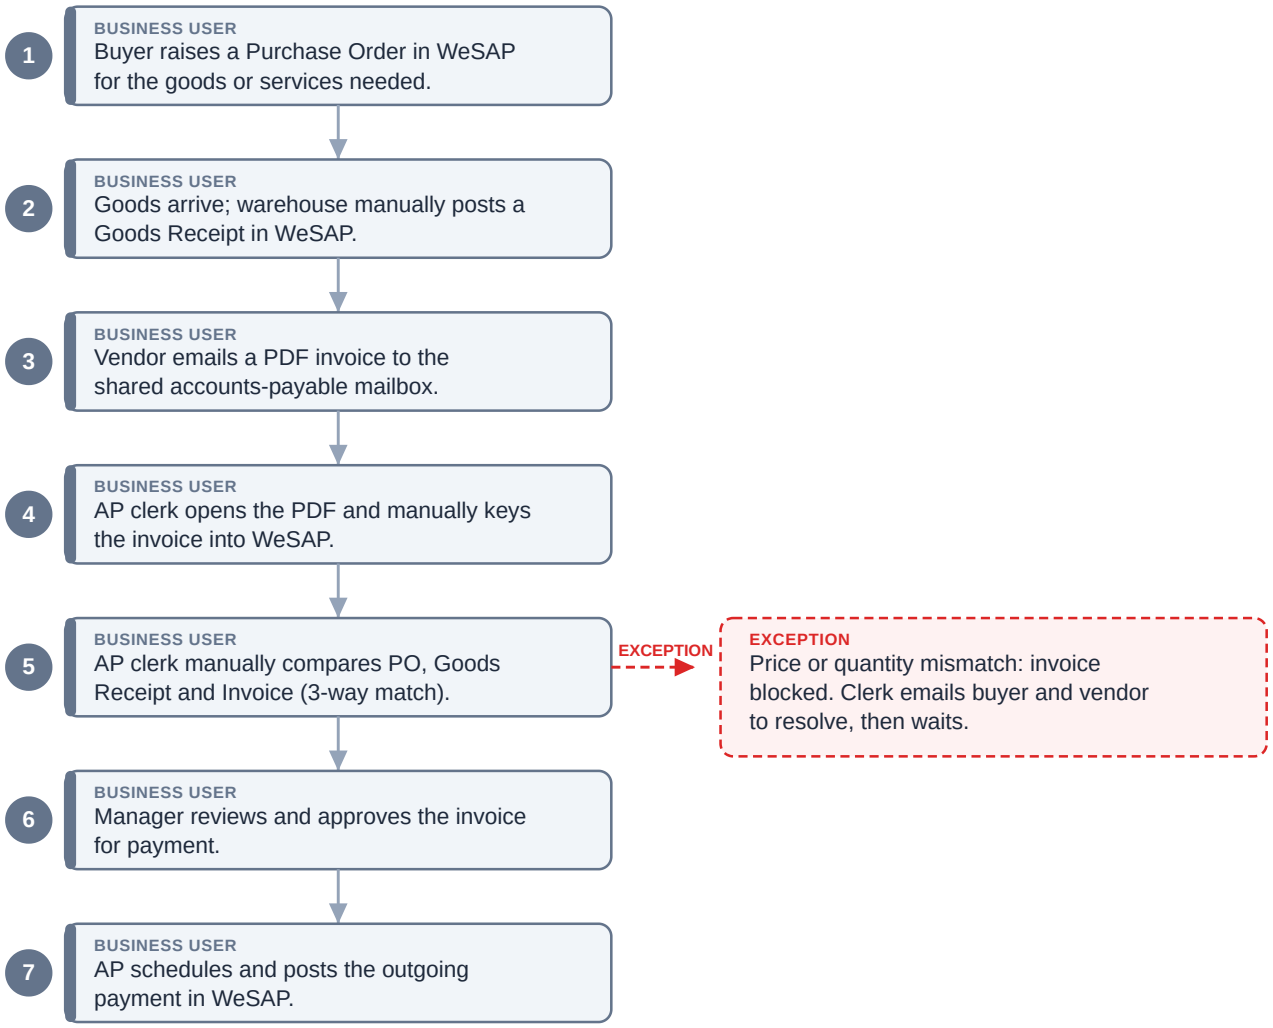

Demo enablement document • process flows, as-is vs to-be, and reusable demo scenarios
Prepared for solution-architect demos · agentic AI & RPA

Process 1 Purchase-to-Pay (P2P)

> Purchase-to-Pay is the procurement cycle: identify a need, order from a vendor, receive the goods, process the vendor's invoice and pay. In WeSAP it runs Purchase Order → Goods Receipt → Supplier Invoice → 3-way match → Payment.

WeCPQ (quote) · WeSAP (ERP) · UiPath robot · Business user · Exception path

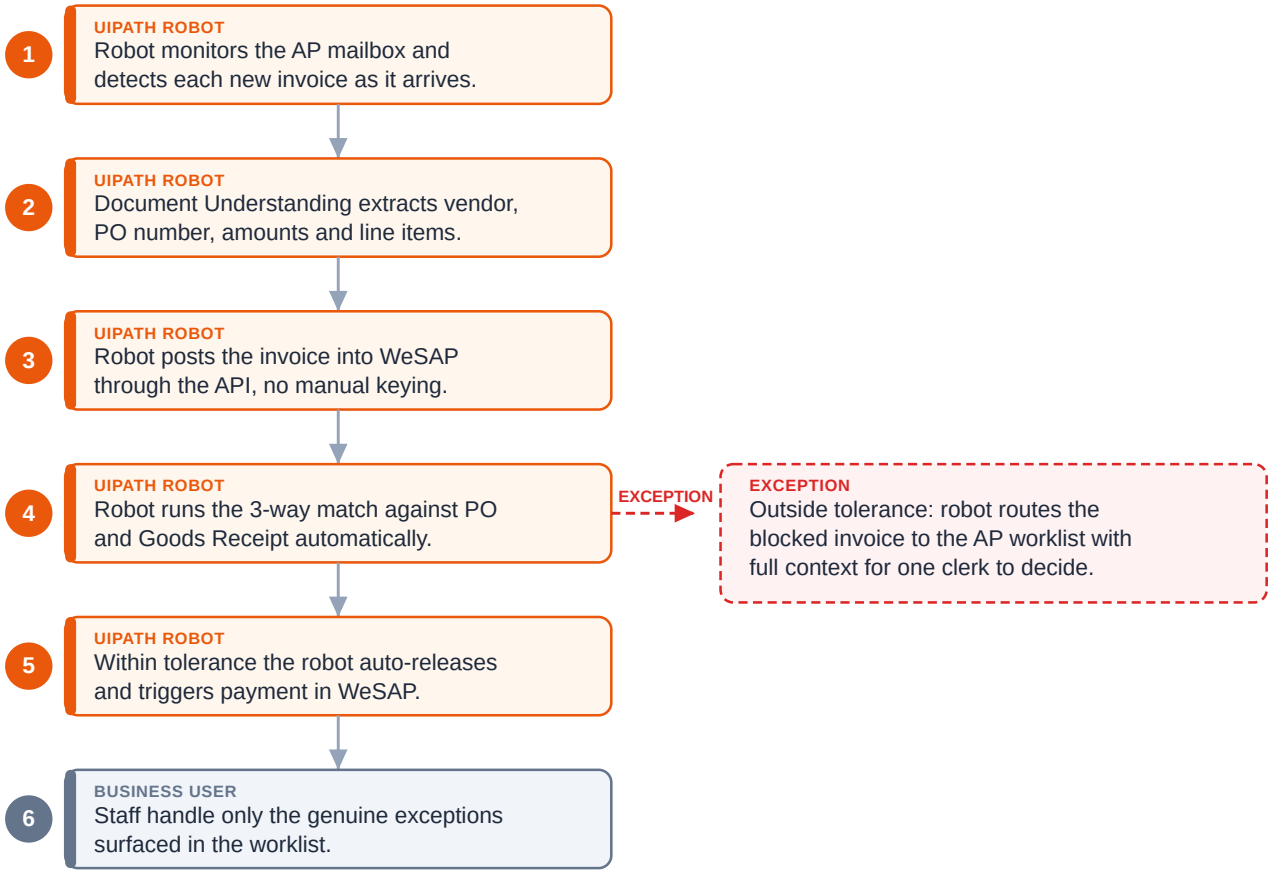

As-is — today, without automation

⚠ Why it hurts

- Manual keying of every invoice — slow and error-prone.
- 3-way matching done by eye; discrepancies chased over email.
- Blocked invoices stall with no clear owner or audit trail.
- Volume spikes at month-end create a payments backlog.

To-be — with UiPath automation

✓ What improves

- Clean invoices flow straight through — no human touch.
- Automated 3-way match with a defined tolerance band.
- Only true exceptions reach staff, with full context attached.
- Faster cycle time, fewer errors, complete audit log.

Process 2 Order-to-Cash (O2C)

> Order-to-Cash is the revenue cycle from customer order to collected cash. Here it spans two systems: a quote in WeCPQ becomes a Sales Order in WeSAP, then Delivery → Billing → Payment.

WeCPQ (quote) · WeSAP (ERP) · UiPath robot · Business user · Exception path

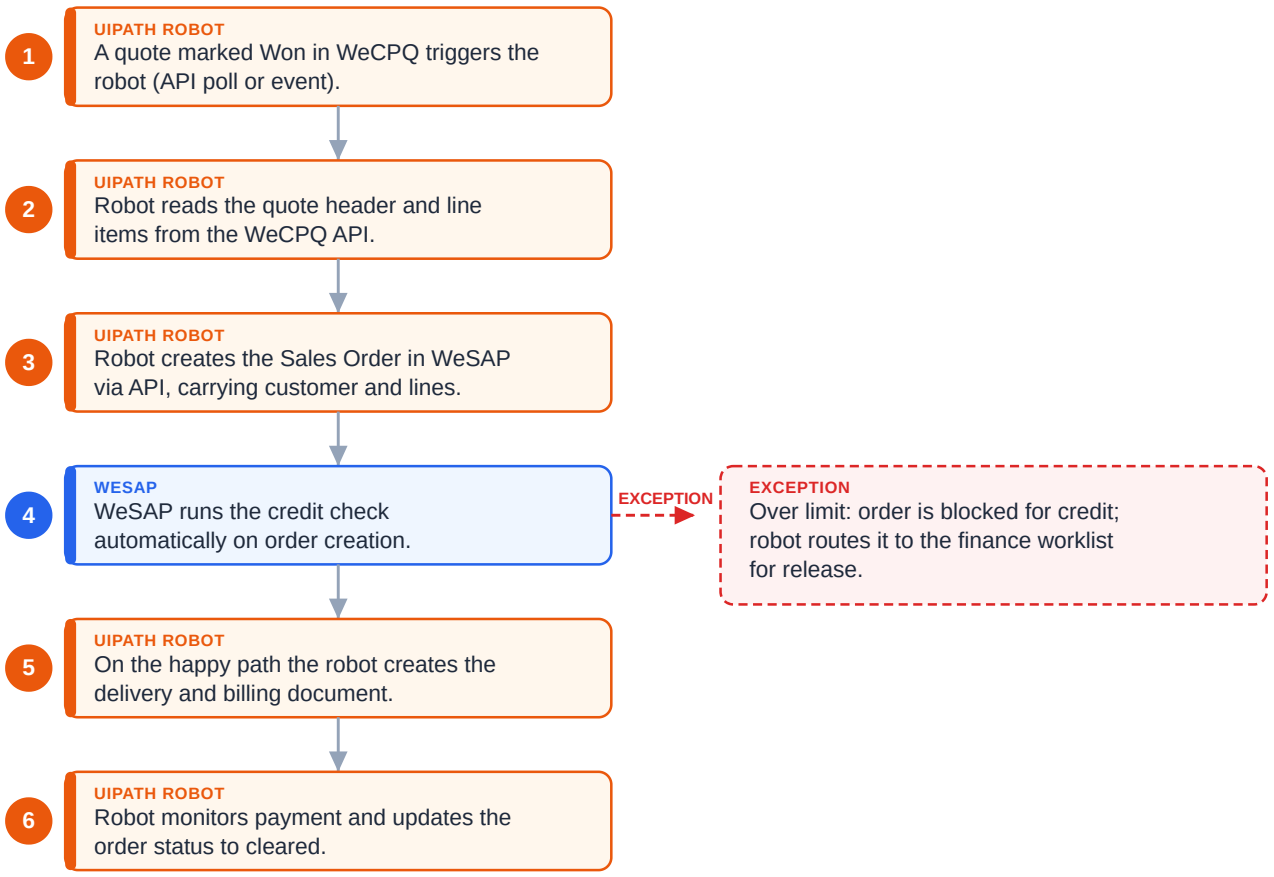

As-is — today, without automation

⚠ Why it hurts

- The Won quote is re-keyed into WeSAP by hand (swivel-chair).
- Re-keying introduces errors and delays order confirmation.
- Credit checks are manual and inconsistent.
- The two systems are disconnected; status is opaque to sales.

To-be — with UiPath automation

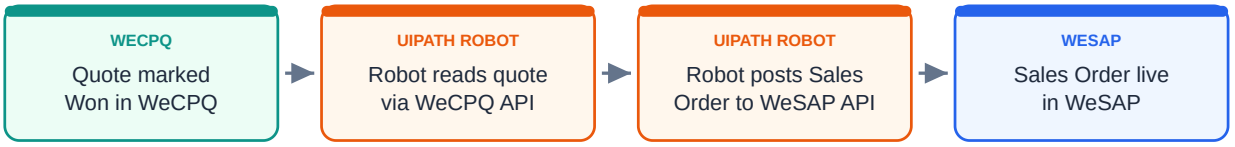

✓ **What improves**

- Quote-to-order is straight-through — zero re-keying.
- Orders are created in seconds, the moment a quote is Won.
- Credit exceptions are surfaced automatically to finance.
- WeCPQ and WeSAP stay consistent end-to-end.

Process 3 Quote-to-Order Bridge — the flagship joint demo

> A three-minute spotlight carved out of Order-to-Cash: it shows WeCPQ, WeSAP and UiPath working as one. Nothing communicates “automation across systems” faster.

WeCPQ (quote) · WeSAP (ERP) · UiPath robot · Business user · Exception path

The robot is the only thing that touches both systems — neither app knows the other exists. That is the honest RPA story.

✓ Why it lands in a demo

- Two recognisable systems on screen (a CPQ and a SAP-style ERP).
- A visible before/after: manual re-keying vs an instant, hands-free order.
- Natural springboard into the credit-limit exception for the “agentic” act.

More demos

Additional scenarios with WeCPQ & WeSAP

> Beyond the two core processes, the same two apps support a family of demos — from simple straight-through automation to agentic, human-in-the-loop decisioning.

Scenario	Systems	Showcases	Impact
Quote-to-Order bridge	WeCPQ → WeSAP	API-to-API integration across two systems	★★★★★
Blocked-invoice handling	WeSAP	Agentic decisioning on exceptions	★★★★
Credit-limit review & release	WeCPQ + WeSAP	Human-in-the-loop judgement	★★★★
Customer master-data sync	WeCPQ + WeSAP	Data integrity / integration	★★★
AR/AP aging & cash report	WeCPQ + WeSAP	Multi-system reporting	★★★

1. Quote-to-Order bridge

Systems: WeCPQ → WeSAP • **Showcases:** API-to-API integration across two systems

The single highest-impact demo: a Won quote in WeCPQ is turned into a WeSAP Sales Order by the robot in seconds. Isolates the cross-system “swivel-chair” that RPA removes.

2. Blocked-invoice handling

Systems: WeSAP • **Showcases:** Agentic decisioning on exceptions

Robot works the WeSAP worklist of blocked invoices, gathers PO and Goods-Receipt context, auto-releases those within policy and escalates the rest with a summary.

3. Credit-limit review & release

Systems: WeCPQ + WeSAP • **Showcases:** Human-in-the-loop judgement

Robot detects credit-blocked orders, compiles customer exposure (open orders, overdue invoices), recommends approve/reject and releases on human approval.

4. Customer master-data sync

Systems: WeCPQ + WeSAP • **Showcases:** Data integrity / integration

A new or updated customer in one system is propagated to the other, keeping master data aligned. Quiet but essential — it underpins every cross-system demo.

5. AR/AP aging & cash report

Systems: WeCPQ + WeSAP • **Showcases:** Multi-system reporting

Robot pulls open payables from WeSAP, open receivables/billing and the WeCPQ pipeline into one consolidated report or email for finance.
